## Simple and safe gardening system

Environmentally Safe Around Family And Pets

We (HealthyEarth) have more than 4 generations of professional horticultural experience. We know how to make gardening easy and successful for you in just a few easy steps. The secret to beautiful healthy gardens and green thumbs is all in the health and fertility of your soil. We have made the products and designed the bio technology so that all you have to do is just add water and it all starts to work very quickly !

### Vegetable, fruit tree gardens and Landscape/lawn gardens

After preparing your site it's just a few really simple steps using our HealthyEarth Environmental Products.

Soil Health Conditioner

Organic fertilizer

Volcanic Rock Dust

Liquid NPK fertilizer

Plant Spray.

**Step1. Apply our liquid 'Soil Health Conditioner'** / which also breaks up heavy soil in the garden bed or lawn. This prepares and conditions the soil by softening and sweetening it and also adding many vital minerals including calcium and magnesium in the correct balance. Good for heavy and sandy soils. Can be applied and plant the same day. Replaces gypsum. Very easy and clean to use.

Application mix 200 mls in 9 ltr watering can and apply to 10 sq mtrs. Water in thoroughly with a hose.

### Step 2. Water in your plants and seedlings with our 'Liquid NPK Fertilizer'

This helps prevent root shock and puts plenty of available NPK nutrients, soil wetting agents and trace elements in the soil directly around the roots. They stand up nice and quick and get growing.

Application only 20 mls per litre of water or 200 mls in a 10 ltr watering can. Very economical but make sure you measure the concentrate accurately ! Give each plant plenty of mixed up 'Liquid Fertilizer' to water them in properly, nice and deep so there is plenty for the plants to drink. 20 ltrs makes 1000 ltrs of liquid fertiliser !

### Step3. Side dress with our 'General Purpose' environmental Garden fertilizer 7 days after planting.

This gives the flavour to your veggies and adds lots of organic nutrients, volcanic rock dusts, trace elements and NPK into the soil just as the plant is starting to grow. It also helps with disease resistance by making the plants very strong. Application only 100 grams per square metre and water in.

Hint: when you see the bottom leaves start to turn yellow this means the plant is starting to get hungry again. You can see this happen when the flowers are about to start forming. This means its time to feed them again with our GP fertilizer

### Step 4. Spray with our organic 'foliage protectant and fertiliser' called 'Plant Spray' to protect, feed and clean the plant.

This helps stimulates veggies, flowers and fruit and repels insects and disease - and feeds the leaves at the same time! A fantastic environmentally safe spray. No withholding period. Excellent for spraying on plants with white fly, powdery mildew, aphids, scale, sooty mould, lace bug. It has all of the NPK and trace elements the plants need for prize winning vegetables. No more poisons in your food and vegetables!

Application only 20 mls per litre of water and spray on every 7 to 14 days. suitable for all plants. Peas and beans and sensitive plants use half strength.

**Step 5. Sprinkle the area with Trace Element 'Volcanic Dust'** ( Biodynamic soil activator) helps healthy microbes grow. This product is great for mineralizing soils with natural trace elements. It helps sweeten and soften soils. It helps give fruit and vegies better taste and nutrition. It helps make the plant more insect and disease resistant and also more drought/ drying out resistant. Also good for adding to compost and worms farms.

**Everyone knows** volcanic soil is the best on earth producing the sweetest healthiest, crops which in turn provides good human health. Easily transform your soil into health giving volcanic soil with this product. It helps fertilisers work even better ! Application just 50 grams per sq mtr

**Use this garden system and you will have Beautiful Gardens - We Promise!**
